DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1 and 3 to 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Roth et al (4662956) in view of Quin et al (6136211) and admitted prior art.

The Roth et al reference teaches a method of depositing an epitaxial layer of silicon on to a doped silicon substrate, note entire reference. A doped silicon substrate is placed into a chamber. The substrate is treated with plasma to clean and etch the top surface, note col. 3. Then a layer of epitaxial silicon is deposited on the substrate, note col. 4. The difference between the instant claims and the prior art is the use of fluorine in the plasma and dopant concentration. However, the Quin et al reference teaches

Art Unit: 1722

that SF or fluorine is part of the plasma that cleans and etches a silicon substrate, note examples. The admitted prior art teaches that the dopant concentration is known to the art, see specification. It would have been obvious to one of ordinary skill in the art to modify the Roth et al process by the teachings of the Quin et al and admitted prior art in order to decrease the time needed to clean and etch the silicon surface decreasing processing times.

Response to Applicants Arguments

Applicant's arguments with respect to claims 1 and 3 to 9 have been considered but are moot in view of the new ground(s) of rejection.
